-2-

The exact figures for armour penetration were not known but

it would penetrate any known tank at a range of 1000 metres and that was the reason for the very high muzzle velocity.

The gun was equipped with three types of sights as follows:-

A pancramic sight fitted to the right of the barrel when required but, when not in action, carried in a metal case attached to the trails. This sight had 60 graticules each one representing six seconds giving a total of 6 degrees.

A telescopic sight with simple cross wires; this was used only for direct fire.

A normal type fore and back sight as on a rifle, used if the other sights were out of action, or to give a very rough approximate aim.

In addition to the panoramic sight, the metal case attached to the trails also contained a few spare parts, tools and cleaning kit etc.

No further details were available.

THE AUX/PROP 85mm GUN.

'MOLOTOW' MC meter with a fuel tank of 50 litres capacity in one or other of the trail legs. The max speed on roads with the gun team of six men mounted, was 30 - 35 Km per hour; the max across country was not known.

The drive was to the auxilery wheel, the engine being coupled by a shaft directly on to the wheel hub. There were three forward and one reverse gears. When not required the wheel was uncoupled from the engine and folded on top of the trail leg. The range etc was not known and no further details were available.
